Caroline & William Herschel

- 1 planet
- 4 moons
- 8 comets
- 5000 other objects

Herschel 1800a

"In this case, radiant heat will at least partly, if not chiefly, consist, if I may be permitted the expression, of invisible light; that is to say, of rays coming from the sun, that have such a momentum as to be unfit for vision."

F. W. Herschel, "Experiments on the refrangibility of the invisible rays of the Sun," *Philos. Trans. R. Soc.*, vol. 90, pp. 284–292, 1800. doi: 10.1098/rstl.1800.0015

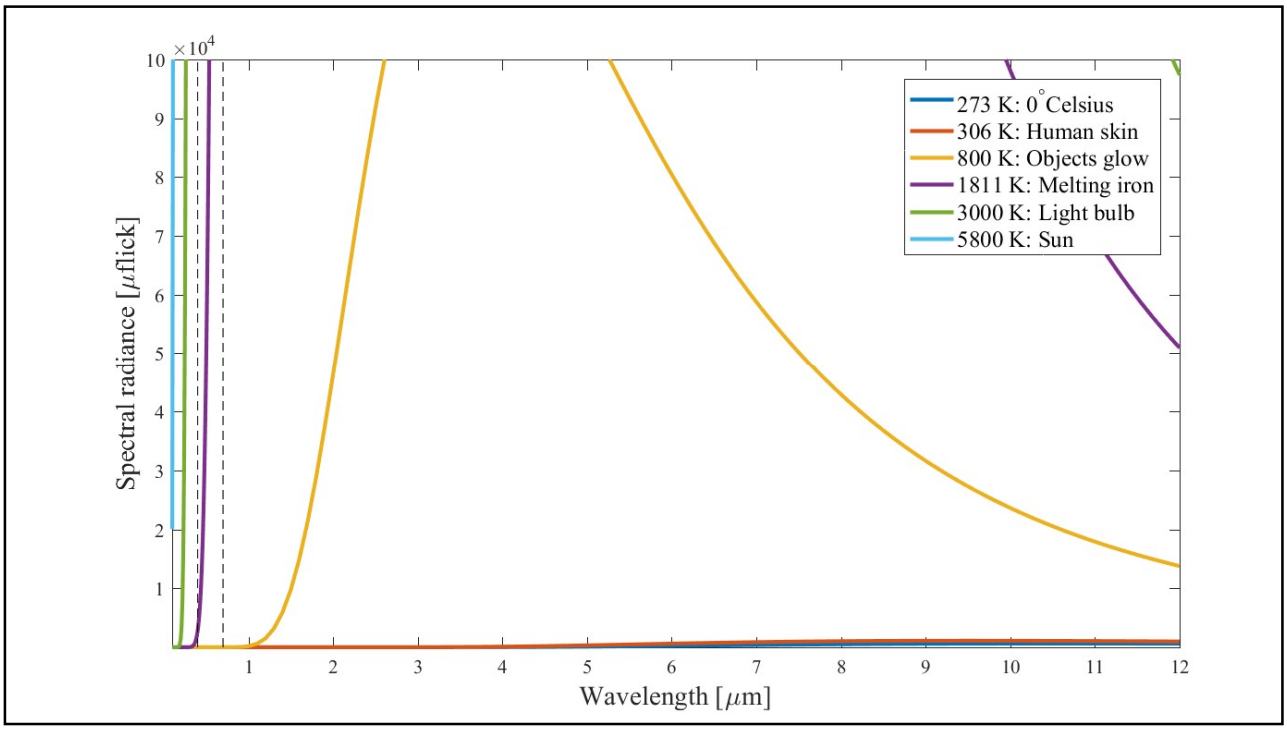
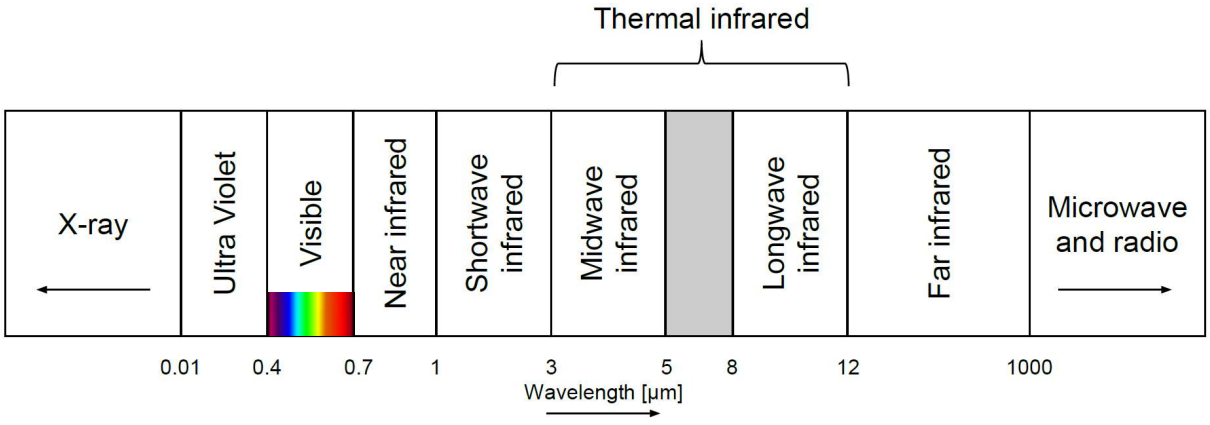
14



15

Domains and wavelengths and bands

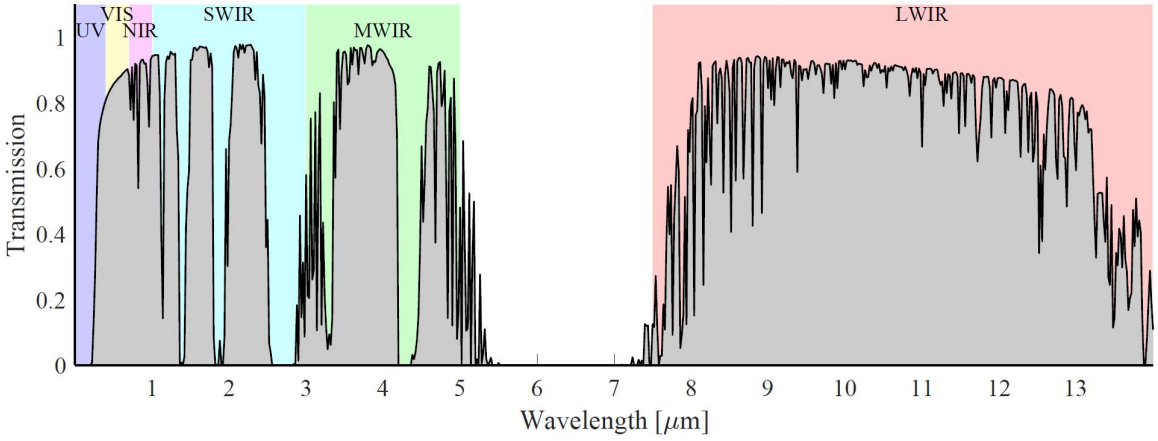
Why this particular division?



LINKÖPING UNIVERSITY

16

Reason 1: Atmospheric transmission



LINKÖPING UNIVERSITY

17

Reason 2: Behaviour

- Reflective domain
- Emissive domain

LINKÖPING UNIVERSITY

18

Reason 3: Sensors

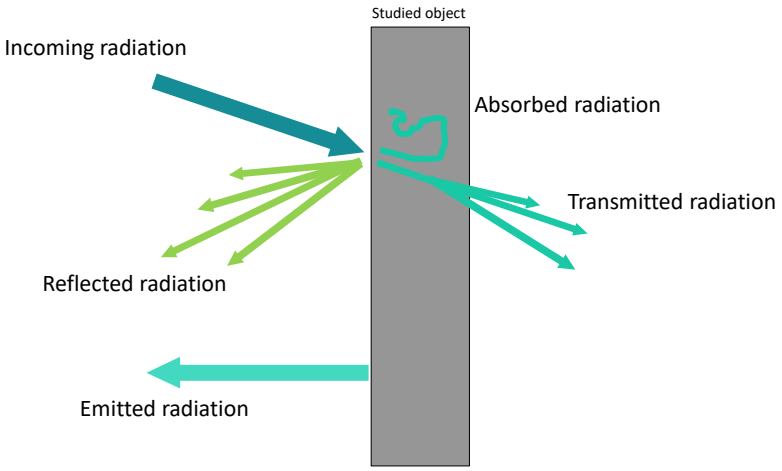
- VNIR: Silicon (CCD, CMOS)
- SWIR: InGaAs sensors
- MWIR: InSb and MCT sensors
- LWIR: MCT and bolometer sensors

Note:
There are other subdivisions!
For example, astronomers use:
- NIR 0.7-5
- MIR: 5-(25…40)
- FIR: (25-40)-

Radiation & Matter

Radiation and matter

- Absorbed
- Reflected
- Transmitted
- Emitted
- Scattered
- Diffracted



LINKÖPING UNIVERSITY

21

$$\alpha + \tau + r = 1$$

$$\alpha(\lambda) + \tau(\lambda) + r(\lambda) = 1$$

$$\alpha = \varepsilon$$

22

- Absorptivity α
- Emissivity ε
- Transmittance τ
- Reflectance r

- α + τ + r = 1
- Dependent on wavelength and angle!
- Commonly: τ or r close to zero.

- (Radiant) Flux Φ [W]
- Radiance L [W / m² sr]
- Irradiance E [W / m²]

From object to sensor

- A sensor integrates the incoming energy over a certain bandwidth.
- The at-sensor radiance is (mainly and typically) the sum of
  1. Radiation emitted by the object and transmitted through the path;
  2. Radiation reflected by the object transmitted through the path;
  3. Radiation emitted by the path;
  4. Radiation scattered by the path.
- This does not equal the temperature of the object!

Summary: Light and radiation

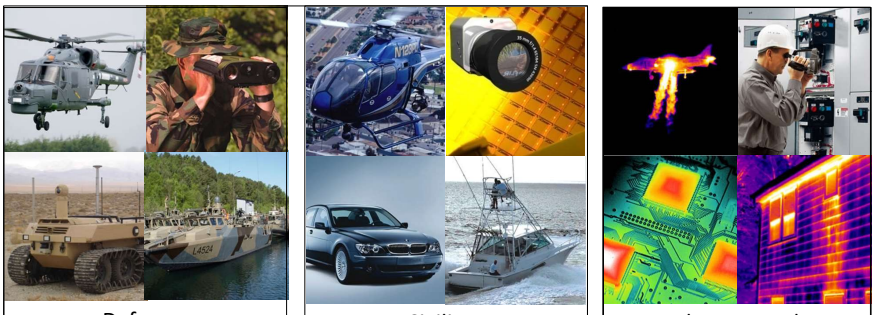
- Radiators: Blackbodies, greybodies, general objects.
- Properties: Emissivity, absorptivity, reflectance, transmittance.
- Radiation often measured as flux, radiance, and irradiance.
- Domains: Reflective vs emissive.
- Bands: UV, VIS, NIR, VNIR, SWIR, MWIR, LWIR, TIR, FIR.

Thermal cameras

LINKÖPING UNIVERSITY

29

Thermal cameras



Defence	Civilian	Thermography
Imaging (non radiometric)		Temperature measuring (radiometric)

LINKÖPING UNIVERSITY

30

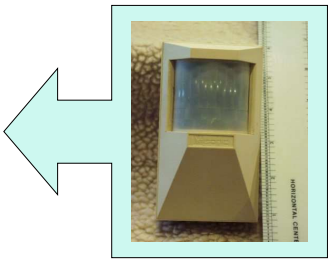
Low-end 	Medium 	Advanced 	Automation, monitoring, R&D 
SWIR 	High performance for R&D 	High resolution for R&D 	Gas finder cameras 

Cooled and uncooled cameras

Sensor type / material		Used for
Cooled		
Mercury cadmium telluride	MCT	SWIR – LWIR
Indium antimonide	InSb	NIR – LWIR
Strained Layer Superlattice	SLS	MWIR, LWIR
Un-cooled		
Charged-coupled device	CCD	VNIR
Active-pixel sensor	APS / CMOS	VNIR
Indium gallium arsenide	InGaAs	NIR, SWIR
Microbolometer		LWIR

Uncooled cameras

- Pyro-electric detectors
- Microbolometers



The common detector in handheld and industrial IR cameras.

Internal radiation

- Much of the radiation hitting the sensor is emitted by the camera
  - 90% is a realistic value
- Thus:
  - One or more internal thermometers
  - On-board processing

3 thermometers in this one!

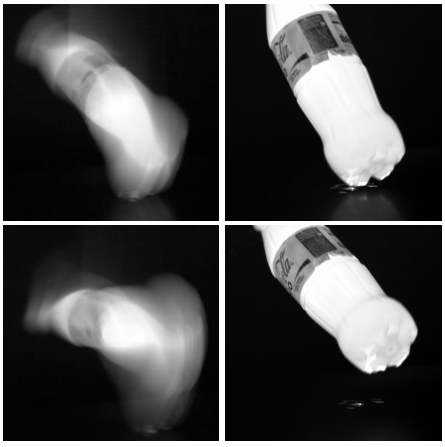
Cooled cameras

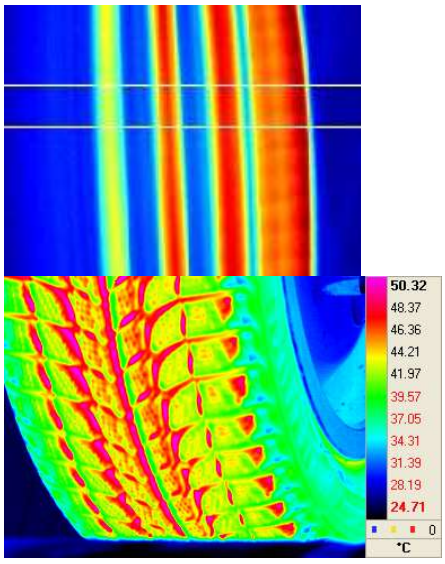
- High spatial resolution
- High temperature resolution
- Fast
- Loud
- Heavy
- Large
- Expensive

LINKÖPING UNIVERSITY

35

Cooled vs uncooled



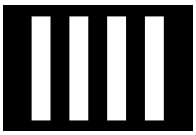


LINKÖPING UNIVERSITY

36

Performance measures

- NETD: Noise Equivalent Temperature Difference
- MRTD: Minimum Resolveable Temperature Difference



- NEP: Noise Equivalent Power

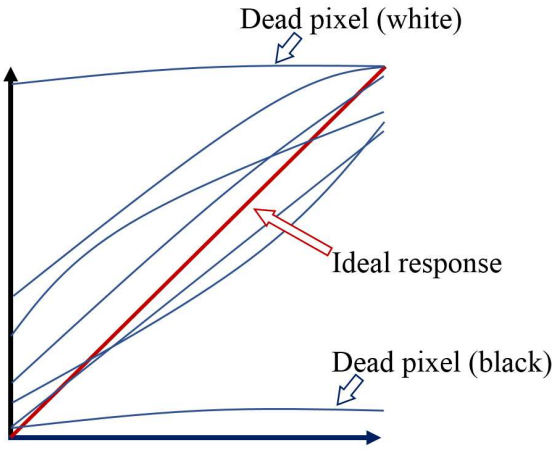
$$\mathrm{NEP} = \frac{\sigma^2}{R} \quad \left[\frac{\mathrm{W}}{\sqrt{\mathrm{Hz}}}\right]$$

- Normalized Detectivity D*
  - Indepedent of detector size and speed

$$\mathrm{D}^* = \frac{\sqrt{A\,\Delta f}}{\mathrm{NEP}} = \frac{R\sqrt{A}}{\sigma^2} \quad \left[\frac{\mathrm{cm}\sqrt{\mathrm{Hz}}}{\mathrm{W}} \text{ or Jones}\right]$$

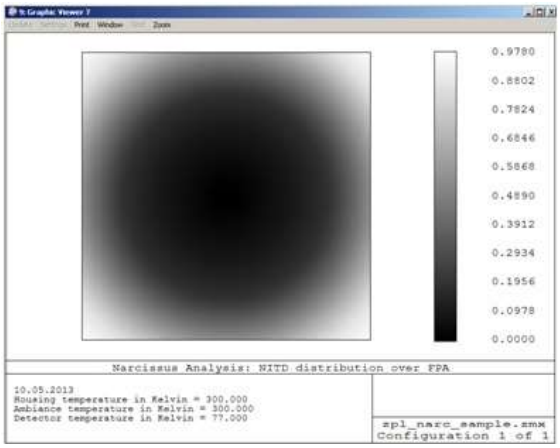
LINKÖPING UNIVERSITY

Calibration and NUC



LINKÖPING UNIVERSITY

Narcissus

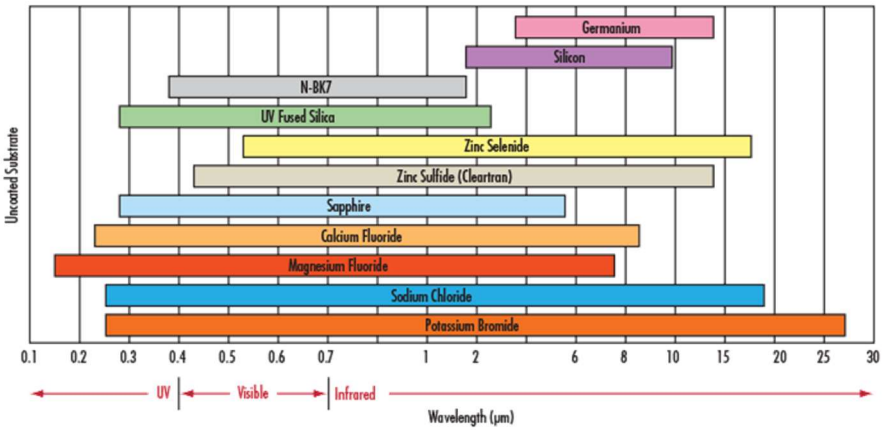


Optics for thermal cameras

Parameters

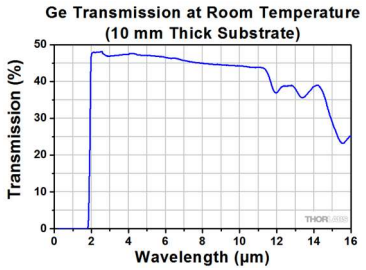
- Durability
- Refractive index
- Variability due to heat
- Cost
- Transmittance

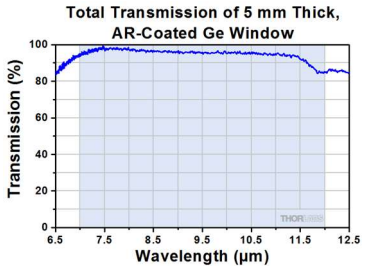
Materials



Lens materials: Germanium

- Good for MWIR and LWIR (with AR coating)
- Durable (KH 780)
- High refractive index (4.0)
- Transmittance drops with temperature!



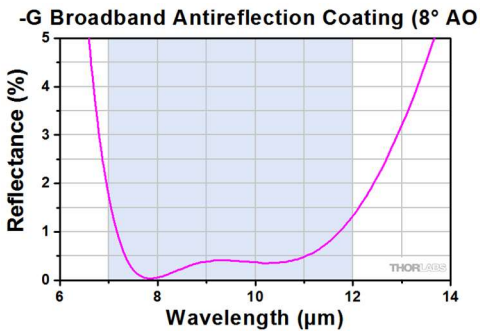


LINKÖPING UNIVERSITY

43

Lens materials: Zinc Selenide

- Transmits even better than Germanium!
- KH 120 ☹
- Toxic

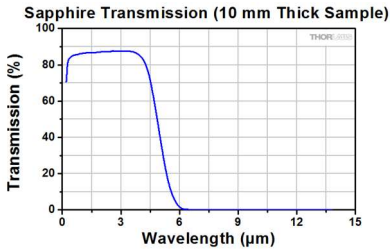


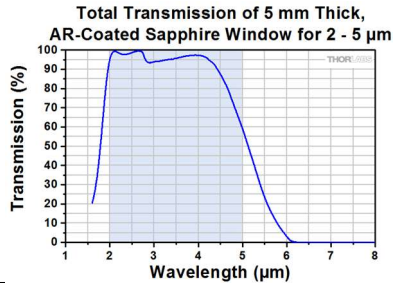
LINKÖPING UNIVERSITY

44

Lens materials: Sapphire

- Durable (KH 2200).
- Good transmittance in VIS-MWIR.





LINKÖPING UNIVERSITY

45

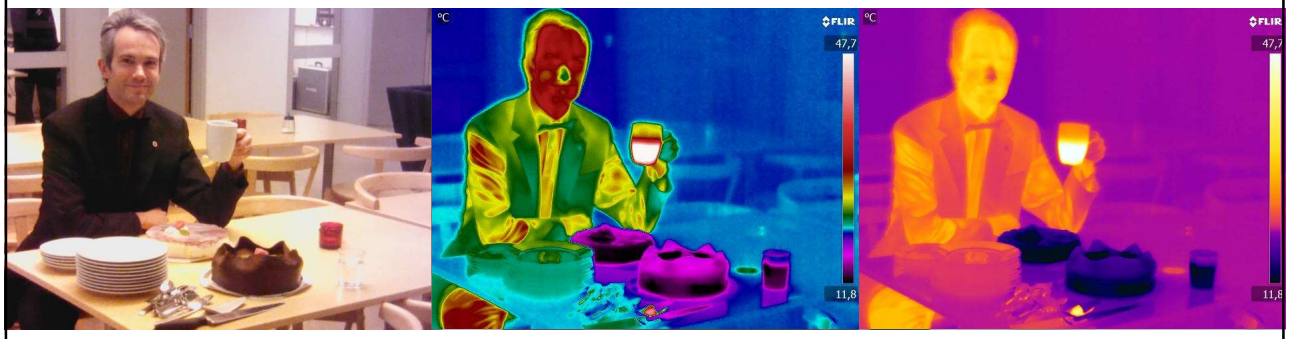
A note on color

Visual White hot Black hot

LINKÖPING UNIVERSITY

46

A note on color



Visual Rainbow Iron

Summary: Thermal cameras

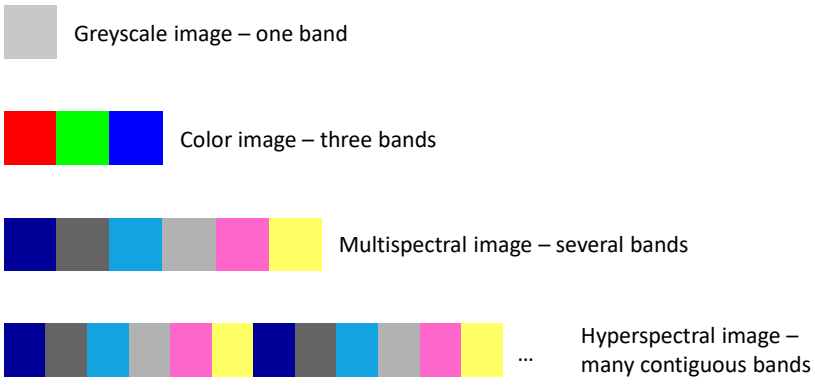
- Cooled vs uncooled
  - Cooled: Loud, cumbersome, expensive, fast, sensitive.
- Sensors: Thermal detectors vs photon detectors
- Optics: Transmitting in different bands
- The most common thermal camera: Uncooled bolometer camera for LWIR with Germanium lens.
- Calibrations: Narcissus, NUC, Drift

Multi- and hyperspectral imaging

LINKÖPING UNIVERSITY

49

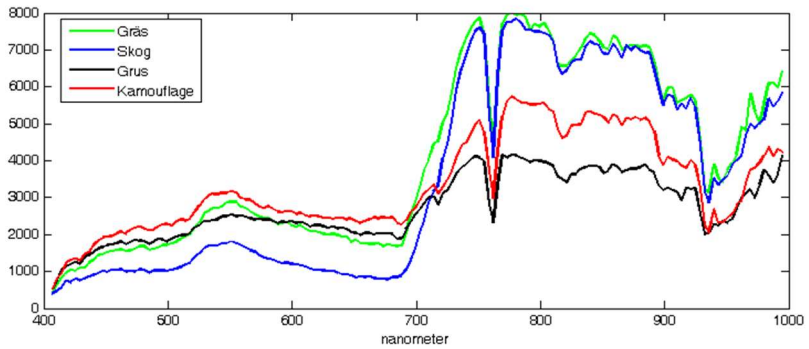
What is multi/hyperspectral imaging?



LINKÖPING UNIVERSITY

50

Why multi/hyperspectral images?



LINKÖPING UNIVERSITY

51

Applications

- Defence
- Mineralogy
- Land-use classification
- Precision farming
- Food inspection
- Environmental monitoring
- …

LINKÖPING UNIVERSITY

LINKÖPING UNIVERSITY

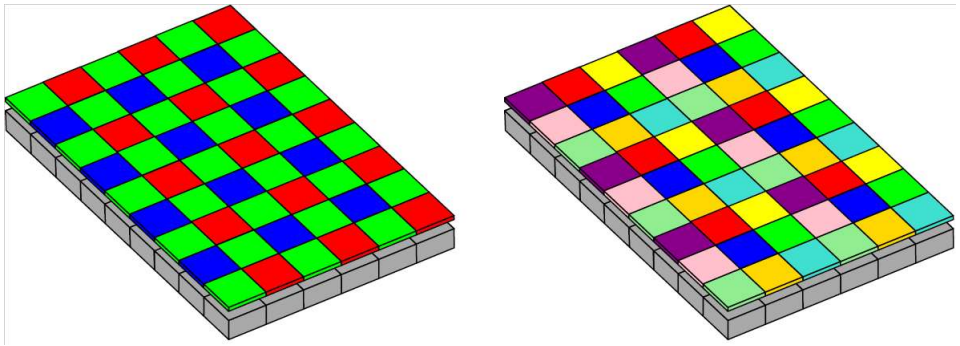
57

Multispectral cameras

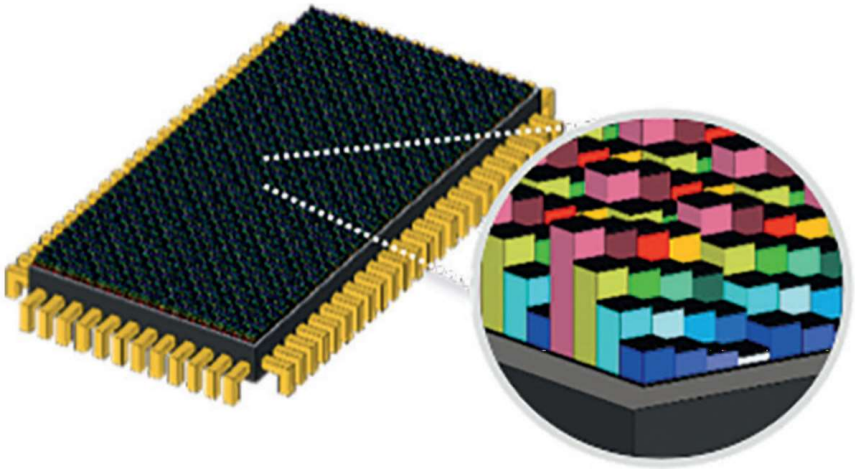
LINKÖPING UNIVERSITY

58

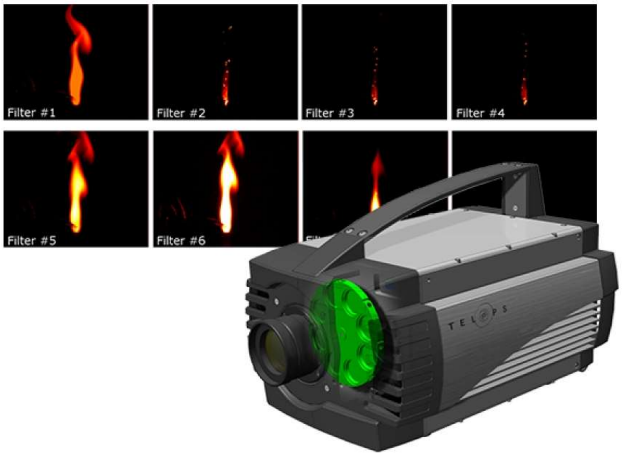
Filter mosaics



16-band sensor from IMEC



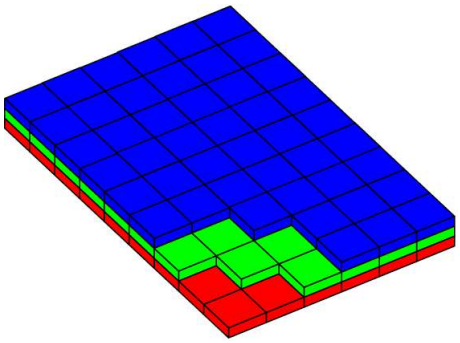
Filter wheels



LINKÖPING UNIVERSITY

61

Multi-layer sensors

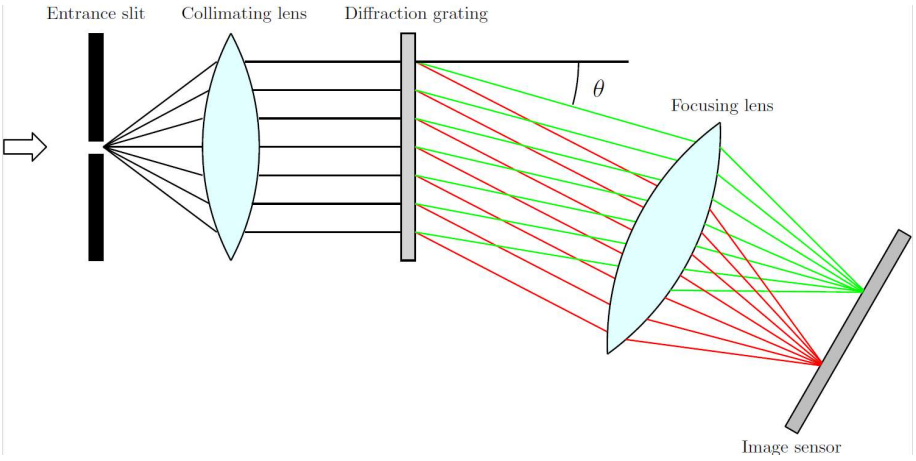


LINKÖPING UNIVERSITY

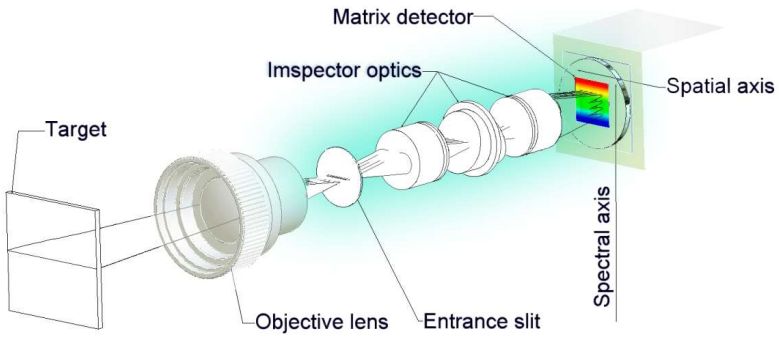
62

Hyperspectral cameras

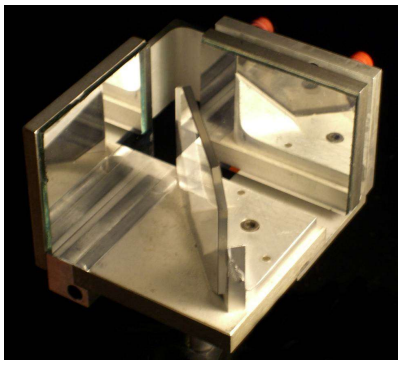
Diffraction grating

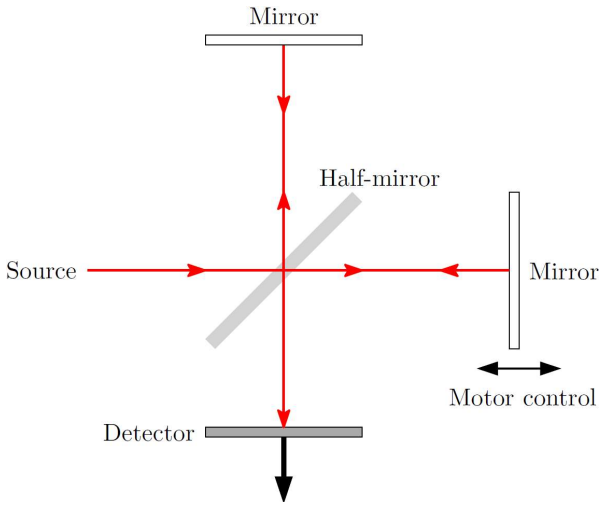


Specim

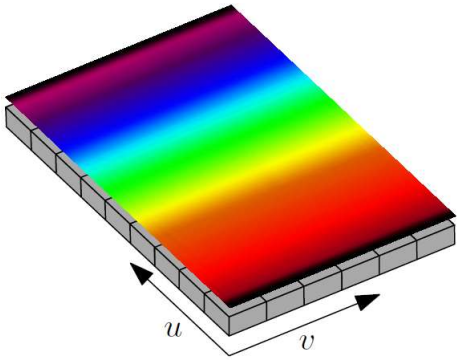


Interferometer





Continuously variable optical band-pass filter



Summary: Multi/hyperspectral

- Use multiple wavebands to see better!
- Recognize materials in one pixel!
- Many ways of making M/HS cameras.
- Applications: Mostly remote sensing and military, others upcoming, especially life sciences and agriculture.
